Atlas spektral'nykh liniy dlya steklyannogo spektrografa (Atlas
of Spectrum Lines for the Glass Spectrograph) [2d ed., rev.]
Alma-Ata, Izd-vo AN KazSSR, 1960. 61 p. Errata slip in-
serted. 2,000 copies printed.

Sponsoring Agency: Akademiya nauk Kazakhskoy SSR.

Ed.: V. V. Aleksandriyskiy; Tech. Ed.: Z. P. Rorokina.

PURPOSE: This atlas is intended for spectroscopy experts work-
ing on the analysis of ores, metals, and alloys.

COVERAGE: The atlas contains photographs of an arc spectrum
of iron in the range of 3718-9010 Å on which the location
of more than 1,300 of the most intensive spectral lines of
81 elements, including inert gases and plutonium, are re-
corded. Wavelength tables of spectrum lines include

"Interrelation Between Thyroid Hormones and Essential Fatty Acids"

Budapest, Acta Physiologica Academiae Scientiarum Hungaricae, Vol 29, No 3-4, 8 Jun 1966, pp 225-234.

Abstract: [English article] Since both fatty acids and thyroid hormones are frequently used as hypocholesterolaemic agents, the authors investigated the effect of thyroid hormone administration on rats maintained on a synthetic diet deficient in essential fatty acids. The deficiency reduced fertility in both sexes; fetuses were absorbed in some cases and the females failed to lactate. Triiodothyronine, in doses of 1.0 μ g /rat/day markedly enhanced the essential fatty acid deficiency; thyosine, in doses of 10 μ g /rat/day showed no such effect. The symptoms disappeared upon treatment with highly unsaturated fatty acids in doses of 0.1 ml /rat/day. 26 references, including 1 German and 25 Western. (Manuscript received 21 Jun 1965).

19L19 (Azerb. khim. zh., no. 1, 1961, 23 - 30)

TEXT: The condensation of toluene with 1,2-dichloro ethane in the presence
of an Al-TiCl_4 mixture is described. Optimum conditions were established
for the preparation of symmetric ditolyl ethane. It has been shown that
finished AlCl_3 can be replaced by commercial aluminum powder with TiCl_4
or AlCl_3 additions as initiator. [Abstracter's note: Complete trans-
lation.]

TITLE: Esters of petroleum naphthenic acids with mono- and polyhydric alcohols and phenols

SOURCE: IVUZ. Neft' i gaz, no. 1, 1966, 59-62

TOPIC TAGS: ester, phenol, alcohol, esterification, plasticizer, PETROLEUM

ABSTRACT: Esters formed by petroleum naphthenic acids with ethylene chlorohydrin, allyl alcohol, cyclohexanol, benzyl alcohol, di-triethylene glycol, glycerin, pentaerythritol, alkyl phenols, phenol, diphenylolpropane, hydroquinone, naphthols, etc. were synthesized by reacting these alcohols and phenols with acid chlorides. The effect of solvents and ratio of reactants on the yield and direction of the reactions was studied. The esterification of phenols was easier, and narrower fractions of the target products were obtained in higher yields than in the case of alcohols. Preliminary tests of the synthesized esters for their plasticizing properties in polyvinyl chloride (PVC) resins and nitrocellulose showed that diethylene glycol esters of petroleum naphthenic acids in a 1:1 mixture with dibutyl phthalate in the proportion of 60 pts. by wt. of ester mixture per 100 pts. of PVC behave satisfactorily, and the

Title : On the Characteristics of the Chemical Composition of the
Leaves and Roots of Petroselinum Sativum Hoffm.,
Cultivated in Azerbaidjan and the Effects of its Prepara-
tions Upon the Cardi-vascular System

Orig Pub : Uch. zap. Azerb. un-t, 1955, No 2, 53-62

Abstract : The leaves and roots of petroselinum sativum Hoffm. contain
alkoloids, glycosides, saccharides, aromatic oils, or-
ganic acids and vitamins C and K. It was demonstrated in
experiments on mice, which received subcutaneously 1 ml
doses of a 20-30 percent aqueous infusion and decoction
of leaves of roots of Petroselinum, that these prepara-
tions had a depressing effect upon the C.N.S. The effect
of extracts from the leaves was weaker than that from the

TITLE: The effect of small gamma-irradiation doses on growth and development of cotton

SOURCE: Radiobiologiya, v. 5, no. 2, 1965, 309

TOPIC TAGS: cotton, seed, gamma-irradiation, irradiation effect, single radiation dose, growth stimulation, plant culture

ABSTRACT: In experiments conducted in 1959-61 seeds of 108-F cotton and hybrid No. 21 cotton were gamma-irradiated with single doses of 200 to 1400 r before sowing to determine the effects of irradiation on growth and yield. Results show that plants grown from irradiated seeds are characterized by higher plant density per hectare, increased number of bolls per plant, and a higher yield than plants grown from nonirradiated seeds. The optimal radiation dose proved to be 600 r. Irradiation with 600-800 r doses produced the most favorable germination of seeds, plant density, and yield. Orig. arr. has: 1 table.

TITLE: Coherent radiation of an indium arsenide-phosphide p-n diode

SOURCE: Fizika tverdogo tela, v. 8, no. 4, 1966, 1283-1285

TOPIC TAGS: coherent radiation pn diode, indium arsenide, indium phosphide, solid state laser, infrared laser

ABSTRACT: InPAs crystals were obtained by two-temperature step-by-step synthesis (A. Ya. Nashel'skiy, Byull. izobret., no. 12,40, 1966) in conjunction with oriented crystallization. Subsequent treatment of synthesized specimens (P = 94%, As = 6%) containing large (1 cm³) seeds was similar to that used in the preparation of GaAs diode lasers. The diffusion of the acceptor impurity (Zn) from ZnAs₂ was carried out in a sealed tube at 750C during a period of 30 min. Fabry-Perot type resonators were used with distances between mirrors of 0.5 and 0.35 mm. Coherent radiation from these specimens was at 0.942 μ and the threshold current densities at 77K were from 2.5 to 6.0 x 10³ amp·cm⁻². Line narrowing was observed at threshold currents (~5300 amp·cm⁻²) and at 1.5—2 times their value produced spectral widths of

TITLE: Certain properties of InP lasers 9

SOURCE: Fizika tverdogo tela, v. 8, no. 9, 1966, 2610-2615

TOPIC TAGS: solid state laser, semiconductor laser, indium phosphide laser, infrared laser, *INDIUM COMPOUND, PHOSPHIDE*

ABSTRACT: Stimulated emission of InP diodes in the 9060—9080 Å region was compared with that of their GaAs counterparts (see Table 1). InP bars were prepared by the directed crystallization method in the form of large-size polycrystals grained in the direction of the bar axis. The bars were tellurium-doped with electron concentrations of $5 \cdot 10^{17} \text{ cm}^{-3}$. The diffusion of zinc from the gas phase into polished plates each containing 2—3 seeds took place at 750C over a 30-min period. The depth of the p-n junction was 35 μ. The electrical contacts were made of gold which was sputtered on plates at 400C. The bar ends were polished and the sides were roughly worked. The GaAs diodes were prepared in a similar manner with the following exceptions: diffusion of zinc into GaAs lasted 4 hr at 850C under excess As pressure, and the resonator

surfaces and diffusion plane were produced by cleavage along the contact plane. The diffusion depth in both cases was almost identical. As regards the width of directivity, InP lasers (5—7°) were shown to be superior to GaAs lasers (14—19°) by a factor of 3 or 4. InP laser diodes were characterized by a low loss factor ($\sim 7 \text{ cm}^{-1}$)

Card 2/3

L 44600-66

ACC NR: AP6030959

and a gain relatively lower than that of GaAs, expressed in a linear approximation as $k = 3.4 \times 10^{-3} j \text{ cm}^{-1}$, where j (amp/cm²) is the current density. The latter can be due to a lower (than GaAs) quantum yield and to a thick active layer (8—10 μ). The differential efficiencies of the InP laser made it possible to deliver pulsed power of 7 watts at 75 amp at the liquid N temperature. Orig. art. has: 2 tables, 2 figures, and 3 formulas. [YK]

TITLE: Spontaneous radiative recombination in InP p-n junctions at low currents

SOURCE: Fizika tverdogo tela, v. 8, no. 11, 1966, 3383-3386

TOPIC TAGS: indium compound, phosphide, pn junction, radiative recombination, emission spectrum, volt ampere characteristic, tunnel effect, line shift, temperature dependence

ABSTRACT: The authors investigated the emission spectra and the volt-ampere characteristics of diffusion p-n junctions in InP at 9, 77, and 300K, at current densities up to 10^2 a/cm². Data are presented on the emission of strongly doped InP p-n junctions at a weak injection level, and the presence of several emission bands as demonstrated, including one which is undoubtedly connected with the "diagonal" tunneling of electrons through the p-n junction, similar to that occurring in GaAs diodes. The samples were made from large-block polycrystals of InP, doped with tellurium, and the p-n junctions were produced by diffusion of zinc at 750C. Two groups of samples were prepared, with slightly different volt-ampere characteristics. The emission spectra exhibited three bands, connected with the different transitions which are tentatively identified. The widths of the emission lines are estimated and

Card 1/2

ACC NR: AP6036992

the temperature dependence of the line shift is given. One of the bands is connected with "diagonal" tunneling occurring at small forward bias on the junction (from 0.9 to 1.3 volts at 77K). With increasing voltage (1.35 - 1.40), a strong emission band appears with quantum energy much smaller than the width of the forbidden band, which predominates at high excitation levels and depends little on the current. In addition at 1.2 - 1.4 v a weak band appears, due to radiative transitions to a deep level, with a quantum energy near 1.0 ev. All these processes are similar to those described in the literature for GaAs diodes. The authors thank A. Ya. Nashel'skiy and S. V. Yakobson for supplying the InP crystals. Orig. art. has: 2 figures and 1 table.

TITLE: Temperature dependence of the threshold current of injection-type lasers and their continuous emission under liquid nitrogen cooling

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 36, no. 12, 1966, 2213-2215

TOPIC TAGS: laser, injection laser, laser threshold current, laser emission point, laser emission threshold, laser diode

ABSTRACT: The temperature dependence of the threshold current in the 77—200K range was investigated on diodes prepared by vapor-phase and liquid-state epitaxy methods. The vapor-phase specimens were prepared in the conventional way; the epitaxial diodes were prepared by the liquid-phase epitaxy method (as described by Nelson in RCA Review, 24, 1963, 603) from a solution of gallium arsenide in gallium at 920C. The substrates were gallium arsenide p-type plates doped with zinc at a concentration of about $7 \times 10^{19} \text{ cm}^{-3}$. Graphs of threshold current vs. temperature for two epitaxial diodes show a linear dependence (gradients of 1.6 and 1.3% per degree). For vapor-phase specimens, the gradient is 3.9% at 77K; at higher temperatures the gradient declines slowly. The threshold current densities at 77K for vapor phase diodes lie

Card 1/2

ACC NR: AP7001323

within the 800—2000 amp/cm² range, and for epitaxial specimens, between 1600—8000 amp/cm². A formula is given for the conditions of generation as a function of threshold current, voltage on the junction, thermal resistance of the diode, and diode cross section. The formula shows that, at the nitrogen temperature, the threshold current density should not exceed 5700—5800 amp/cm² for epitaxial diodes and 1900 amp/cm² for vapor-phase diodes. Continuous emission was obtained at 1200—1600 amp/cm² in a number of diodes, but in some the threshold was not reached because of overheating. This result suggests that the actual thermal resistance is 3 to 4 times higher than the calculated value. The difference is attributed to insufficient contact between the diode and the cooling agent. Orig. art. has: 1 figure and 2 formulas. [FP]

TITLE:

A Procedure for Determining the Filterability of
Fuel Grade T-1

PERIODICAL:

Khimiya i tekhnologiya topliv i masel, 1961, No. 3,
pp. 63-65

TEXT:

Cases of fuel filter blocking have occurred in aircraft using grade T-1 fuel. It was suggested that these blockages were due to the presence of naphthenic soaps in this fuel. To check this the filterability of the fuel was determined. Under refinery conditions filterability of the fuel was assessed by a method designated TY 573-55 (TU 573-55) which consists in pumping forty litres of fuel through a model aircraft filter with a pressure on the filter of 0.3 kg/cm² and a final rate of filtration of 0.07 litres/min. The filter was made of felt and had a filtering surface of 1 cm². The method has been in use since 1954 and grade T-1 fuel has been found to filter satisfactorily, and in the great majority of cases the final filtration rate is over 0.07 litres/min. Lower values are obtained only if

Card 1/3

S/065/61/000/003/003/004
E194/E284

A Procedure for Determining the Filterability of Fuel Grade T-1

the final purification of the fuel is inadequate. Since the filterability test has been introduced customer complaints have ceased. In order to check the quality of fuel at the place of application a small instrument and laboratory procedure have been developed to determine the filterability of the fuel, the main test conditions remain unchanged. In order to determine the minimum amount of fuel necessary to obtain reliable results tests were made with various grades of filter and amounts of fuel. It was found that filterability of the fuel could be reliably assessed by filtering a quantity of two litres and this amount was used in developing the laboratory apparatus. The equipment consists of a two-litre vessel to which a pressure of 0.3 kg/cm^2 can be applied with appropriate control valves, pressure gauge and air filter. The equipment is made either of steel grade EYa-1T or of bronze and aluminium. To make a test the instrument without filter is washed with the test fuel, the filter element is installed and 2.2 litres of fuel are placed in the container and subjected to a pressure of 0.3 kg/cm^2 . After 200 ml of fuel have

Card 2/3

89127

S/065/61/000/003/003/004
E194/E284

A Procedure for Determining the Filterability of Fuel Grade T-1 passed through the filter the initial rate is determined and then filtration rates are determined after 1 litre and 2 litres have passed. Experience shows that the fuel is satisfactory if the filtration rate is not less than 0.1 litres/min after 2 litres of fuel have passed. If the fuel is contaminated the filtration rate is much reduced. A typical initial rate of filtration is 0.7 litres per minute. The suitability of fuel is determined on site by alkaline reaction of aqueous extract. In the tests all fuels of poor filterability had aqueous extract of neutral reaction showing that no naphthenic soaps were present in the fuel. It is concluded that filter blocking is mainly due to corrosion products and that the naphthenic soaps are only adsorbed on the filter without blocking it. There are 2 figures and 3 tables.
